General Description:

Accepts continuous wave radio frequency signal of 5.450 ghz to 5.825 ghz and processes it in accordance with a command data input to turn output signal on and off and with a frequency phase modulation offset to increase the signal frequency; output used to calibrate phase and amplitude of the two channel monopulse receiver channels; also has fault logic output; provides frequency phase rate offset by shifting rf phase in discrete 45 degree steps driven by internal oscillator; o/a dims 13.50 in. Lg, 8.00 in. W, 4.25 in. H

Shelf Life:

N/a

Unit Of Measure:

--

Demilitarization:

Yes - demil/mli
