End Application:

Hydraulic power unit, 54200zz1bfkm

Design Type:

Reusable

Special Features:

Pressure filter is used to filter the pressure fluid on the hydraulic power unit. Replace the filter element any time the clogged filter indicator light is triggered or when the pop-up indicator located on the filter head changed to red during operations. Replace the filter element annually to ensure proper cleanliness of the hydraulic system. This is a requirement. Standard filter changes depend on how frequently the hpu is used and the cleanliness of the fluid, along with the environment to which the hpu is exposed. Periodic fluid analysis recommended to properly determine the optimum frequency of filter element changes.

Media For Which Designed:

Fuel/oil, hydrocarbon

Shelf Life:

N/a

Unit Of Measure:

--

Demilitarization:

No
