End Application:

Control console 18784 onboard 400 ft wagb cg vessels

General Description:

The 2301 load sensor circuit is designed to render proportional load division with isochronous control of engine-generator sets by similar units in parallel. The 2301 loan sensor monitors the load on its alternator, compares this load to other alternators in the system and adjusts its governor system to carry its alternator's proportional share of load
