Drill Pivot:

Not provided

Err Default:

Err default

Special Features:

The vent-hole punch is a handy palm held device that facilitates creating a hole through sample cups for equalizing pressure differentials. It is designed for placement directly over the sample cups integrating central thermoplastic seals. A simple downward pressure of the knob extends a pointed shaft to the correct direction to create a hole. The spring loaded awl automatically retracts in readiness for additional preparation. Ideally suitably suitable for preparation numerous samples requiring venting
