End Application:

Engine assembly; tf117 pw100

Functional Description:

Pwa81596 puller consists of a flanged steel ring, ten jaws, and assorted standard hardware; ten equally spaced sets of solts are found through the wall of the ring; the flange has ten equally spaced jackscrew, four lifting holes, and a timing slot; the jaws are repositioned with the slots of the ring held in place with shoulder and adjustment screws; the ring is positioned with the timing slot and secured with the jackscrews; the jaws mate with the airseal segments; tightening the jackscrews creates the force to perform the separation
