End Application:

Shout voip migration appliance (vma)

Product Name:

Module, 8 port analog fxs i/f, pwr supply

Special Features:

The shout platform supports from 1 to 32 t1 or e1 ports, 8 fxs ports and 2 ethernet ports, making it a compelling solution for enterprises, government entities and service providers looking to deploy ip-based voice networks. Shout combines the functionality of a media gateway, call control component, ss7/c7 signaling point, h.323/sip inter-working device and media server in a single, compact chassis. Shout supports a wide range of voice and call routing features. All of these are backed by key components that ensure the platform and the calls moving across it are secure. Conformance to the latest voip signaling and call control standards, such as sip and h.323, guarantees interoperability within multivendor voip deployments. Moreover, shout900's support for standards-based signaling mechanisms and inter-working techniques enables the platform to be easily deployed into existing voip networks.
