Product Name:

Assymax human tumor necrosis factor alpha (tnf-alpha) elisa kit

Special Features:

The assaymax human tnf-alpha elisa kit is designed for detection of tnf-alpha in human plasma, serum or cell culture supernatants. This assay employs a quantitative sandwich enzyme immunoassay technique that measures tnf-alpha in 4.5 hours. A murine monoclonal antibody specific for human tnf-alpha has been pre-coated onto a microplate. Tnf-alpha in standards and samples is sandwiched by the immobilized antibody and a biotinylated polyclonal antibody specific for human tnf-alpha, which is recognized by a streptavidin-peroxidase conjugate. All unbound material is then washed away and a peroxidase enzyme substrate is added. The color development is stopped and the intensity of the color is measured.

Shelf Life:

N/a

Unit Of Measure:
