Product Name:

Anion micromembrane suppressor

Special Features:

Anion micromembrane suppressor, designed to suppress the basic eluents used with 4 mm anion exchange columns. The amms-ii is a direct replacement for older chemical suppressor devices including the amms-i and packed bed suppressors. The amms-ii membrane technology accommodates rapidly increasing gradients to significantly higher eluent concentrations, above 100 mm hydroxide, while at the same time maintaining low background conductance, compatible with hplc solvents, can be used with either a pressurized regenerant reservoir or with the autoregen accessory

Shelf Life:

N/a

Unit Of Measure:

--

Demilitarization:

No
